More git commands

Cloning

1. what the cloning means ?

cloning means you can save a copy of a project with all branch and commits , ets in your system as local .

therefor you can add commits offline and send your new commit to orginal file of project later .

2. what the commands make clone ?

we can use this command to do it.

git clone (url of project)

3. cloning a repasitury retain the commit history ?

yes when you clone a ripasitury the history of repasitury are clone in your local project.

Fork in open source project and git hub

1. means of fork : forking a project in github means you get a personal copy of project and make change in copy whisout changing in main project of anyone .

this very helpfull for open sourse project becaus encourages developer to help other in the open sourse project.

2. process of forking : for forking you should go to page of repasitury at github and select fotk in page and fork will be save in your account .

them you make change this fork and commit them , when you commit them they are will save in your account as your project.

3. forking contibute in collaborate ptoject :

- encouraging expeimentation: developer can try any idea without worry about breaking the orginal project.
- facilitating contributions: the developers can make pull request for suggestion to make project better of pull request will be accept the suggest will atomatically apply in project.

4. keeping update cheanges with orginal repasitury : we will at first fetch the main repasitury in local project them merg the local changes in maked remote of main project and push remote to apply cheanges in main repa-situry.

5. contribute to the original repository after forking : to help project at first fork project so make changes and commit it , then push committed changes in git hub.

after we pushing committed change we make a pull request and send it after sending pull request and access by manager of project the changes will be applied in repository.

Git resetting

1. purpose of git reset command in git : it can help us when we want to cancelling new changes and commits and want to go to which commit is exist before.

2. difference between git reset and git revert : git reset delete the commit which you want fix it and you return to before commit and rewrite the code to fix bugs.

git revert make a new commit that commit new commit which has bugs .

therefore better you use git revert in your projects .

3. explaining the three primary mode of git reset :

- git reset --soft :
this command use when you could return a commit but retain ready changes of commit .
- git reset --mixed (default mode):this command use when you could restage a commit but you could have this commit .
- git reset --hard : this command use when you want completely discard all changes without retain any things .

Merging and rebasing

There are two links to see merging in project one and rebasing in project two .
